# Socio-spatial Graph

# Problem Formulation

Given

- ▶ Set of meeting points  $Q$
- ▶ Socio-spatial graph  $G = (V, E)$

Find top  $k$  groups such that

$$\text{score}(G_i, q_i) \geq \text{score}(G_{i+1}, q_{i+1})$$

where  $G_i$  is a subgraph of  $G$ ,  $q_i \in Q$  and  $1 \leq i \leq k - 1$

# Constraints for a feasible group

- ▶ minimum social connectivity constraint  $c$ 
  - ▶  $\text{degree}(v) \geq c, \forall v \in V$
- ▶ maximum distance  $d_{max}$ 
  - ▶  $\text{dist}(v, q) \leq d_{max}, \forall v \in V$
- ▶ minimum group size  $n_{min}$ , maximum group size  $n_{max}$ 
  - ▶  $n_{min} \leq |V| \leq n_{max}$

## Score of group $G = (V, E)$ w.r.t. meeting point $q$

$$\text{score}_{\text{social}} = \frac{2|E|}{|V|(|V| - 1)}$$

$$\text{score}_{\text{spatial}} = 1 - \frac{\sum_{v \in V} \text{dist}(v, q)}{d_{\max}|V|}$$

$$\text{score}_{\text{size}} = \frac{|V|}{n_{\max}}$$

$$\text{score} = \alpha \cdot \text{score}_{\text{social}} + \beta \cdot \text{score}_{\text{spatial}} + \gamma \cdot \text{score}_{\text{size}}$$

# Literature review

There are existing works that address socio spatial group queries. The major gaps are

- ▶ specific group size<sup>6</sup> vs variable group size
- ▶ finding only the best group<sup>6</sup> vs top  $k$  groups
- ▶ fixed meeting point vs multiple meeting points<sup>7</sup>
- ▶ average social connectivity constraint<sup>8</sup> vs minimum social connectivity constraint<sup>9</sup>
- ▶ ranking function combining social and spatial factors<sup>10</sup> vs ranking function combining social, spatial and group size factors

# Contribution

- ▶ Exact algorithm
  - ▶ member ordering based on spatial distance
  - ▶ optimistic assumption (maximum) on social connectivity of including members
  - ▶ early termination based on upper bound on spatial distance

- ▶ Heuristic approximate approach
  - ▶ member ordering based on spatial distance
  - ▶ lower bound on social connectivity while including a member in the intermediate group

- ▶ A fast approximate approach
  - ▶ a tighter lower bound on social connectivity while including a member in the intermediate group
  - ▶ upper bound on spatial distance and lower bound on social connectivity that improves the rank of current exploring group
  - ▶ prune when including a member can not increase the score of intermediate group
- ▶ Greedy approach
  - ▶ avoid backtracking

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  
 $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  
 $\{b, a, c, \dots\}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

select meeting point that has minimum spatial distance to first unexplored member

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

$\{a, b, c\}$  is a result group

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

Advance termination based on upper bound on spatial distance

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

$\text{degree}(c, \{a\}) < \text{lower bound on social connectivity}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

$\text{degree}(c, \{b\}) \geq \text{lower bound on social connectivity}$

# Simulation

- ▶ meeting point  $q_1$
- ▶ distance ordered members  $\{a, b, c, d \dots\}$

- ▶ meeting point  $q_2$
- ▶ distance ordered members  $\{b, a, c, \dots\}$

# Approximation ratio of fast approximate algorithm

$$\text{approximation ratio} = \frac{\text{lowest scoring retrieved group}}{\text{best scoring group that may not be retrieved}}$$

Emphasis	Weights	Approximation ratio
Social score	$\alpha = 1, \beta = \gamma = 0$	$\frac{c}{n_{max}-1}$
Spatial score	$\beta = 1, \alpha = \gamma = 0$	1
Size score	$\gamma = 1, \alpha = \beta = 0$	$\frac{n_{min}}{n_{max}}$

# Experimental Results

Figure: Computation time of different algorithm

<sup>11</sup>[YANG12]

# Experimental Results

A = Approximate, FA = Fast approximate, GA = Greedy approximate

(a) Brightkite

(b) Gowalla

**Figure:** Percentage of groups in top  $k$  of approximate algorithm that also appear in top  $k$ , top  $1.5k$ , and top  $2k$  of the exact algorithm

- ▶ we propose novel top  $k$  flexible social spatial group queries
- ▶ we devise a ranking function combining social closeness, spatial distance, and group size
- ▶ we propose exact algorithm and efficient approximate algorithms
- ▶ Exact algorithm runs up to  $10\times$  faster than the baseline
- ▶ Fast approximate algorithm runs up to  $100\times$  faster than exact algorithm and returns the same set of results in most cases

# Thank You
